

The Florida We are all So Familiar With is a relatively new phenomenon, geologically speaking. This distinctive peninsula of land we live on, and the gently sloping, sandy shorelines we're drawn to for recreation and renewal, have not always existed as they appear today. In fact, Florida was a very different-looking place not so long ago, and over the past 500 million years it has had quite a unique and surprising geological history.

Beauty is in the eye of the Informed: Get to know the not-so-firm terra beneath your feet by exploring the full exhibit text of *Florida Formations*, and then answering the following questions.

Introduction: African Origins and 500 Million Years of Florida Geology

- I. What are the two types of bedrock which constitute Florida's earliest foundation? igneous & metamorphic
- 2. What is the name of the Paleozoic megacontinent to which Florida first belonged?

 Gondwana
- Over 250 million years ago, with which megacontinent did Gondwana collide?

 Laurasia
- 4. What was the result of that collision? the supercontinent Pangea
- 5. What is the chemical formula of the mineral which is the major constituent of the rocks limestone and dolostone? CaCO calcium carbonate
- 6. For how long have these carbonate rocks been accumulating to form Florida's "carbonate platform," and in what type of environment did these depositions originally occur? 200 million years

in warm shallow seas

- 7. What is the name of the channel formation which isolated the Florida Platform from eroded siliciclastic sediments derived from the southern Appalachians and carried by North American rivers?
 - the Suwannee Channel
- 8. What effect did this channel have on the early "carbonate factory" of the platform? it protected the peninsula from siliciclastics, allowing for calcium carbonate deposition
- 9. Where were clays, sands, shales, and conglomerates formed? panhandle Where were limestones and dolostones formed? & north FL the protected waters of the Florida peninsula
- 10. What role did rudists play?

contributed to the build-up of extensive carbonate reefs & shoals

- 11. What are the two major Florida Formations (rock units) from this time period (145-34 mya)? Avon Park Formation & Ocala Limestone
- 12. What type of deposition sequence forms the base of the Floridan aquifer system? evaporite

Part 2: Paradise Island (Oligocene; 34 – 23 MYA)

- 13. What global state during the Oligocene exposed the Florida Platform as a large island or group of islands? "icehouse" state
- 14. What is the primary carbonate rock formation of the Oligocene? Suwannee Limestone
- 15. What different conditions formed the Bridgeboro Limestone and the Marianna Limestone formations? coral & algal patch reefs formed Bridgeboro; muddy calcium carbonate formed Marianna
 - 16. Name three types of organisms from this time period whose fossil remains represent the first major migration of terrestrial (land) animals onto the Florida Platform.

saber-toothed cats, oreodonts, primitive horses

17. What is karstification? What are some of the resulting karst landscape features here in Florida?

karstification is the erosion of carbonate rock sinkholes, springs, underground streams, caves, caverns

Part 3: Florida Connected (Miocene/Pliocene; 23 - 2.6 MYA)

18. What happened to finally fully connect the Florida peninsula to the rest of the North American landmass? the filling up of the Gulf Trough with siliciclastic sediments from the southern Appalachians

- 19. During which time period did quartz-rich (siliciclastic) sediments become the dominant sediment in Florida? the Pliocene
- 20. As a result of this influx of sediments arriving from the north, what began amassing on Florida's fringes, which the state is now famous for?

quartz-rich sediments, sand

- 21. What was the impact of the Panamanian Land Bridge on terrestrial communities? the Great American Biotic Interchange, where S American species moved into N America, including Florida, and vice-versa.
- 22. What accounts for difference in the colors of Florida sand?

different ingredients in quartz sand: calcium carbonate, shell fragments, iron oxide, fossils, etc.

Part 4: Iceless Ice Age (Pleistocene; 2.6 MYA – 11,700 YA)

- 23. How did "The Great Ice Age" impact the Florida landmass? low global sea levels drained the Florida Platform to twice its present width; and cooler, dryer conditions resulted in thinning woodlands, extensive semiarid savannah
 - 24. Which Florida Formation was used to construct the Castillo de San Marcos? Anastasia Formation
 - 25. Name some examples of "Pleistocene megafauna." mammoths, mastodons, bison, dire wolves, giant lions, sabertoothed cats, giant beavers, glyptodonts, giant ground sloths, etc.
 - 26. The emergence of what landform enabled humans to enter North America, and eventually Florida, by land from Asia?

the Bering Land Bridge

- 27. What variety of fine-grained quartz was used by early Native Americans in Florida to make stone tools? chert
- 28. What are two things you learned about Florida's geological past that you hadn't known before?
